

Extra Info

Sooooo, creating batch scripts is impossible on a Mac. The equivalent is shell scripts, which is what I used, hence the file extensions .sh within the cyan and magenta folders. I've included a screenshot of my Terminal running both of these files to demonstrate the output.

I ended up using regular expressions to isolate the file name and print that out without the extension. I'm not sure if this was the way you wanted us to solve this, but I think I met the desired outcome.

As soon as it said "Create a sub-directory called next in each of the color directories." I was lost. Colors as in cyan and magenta? Or blue and red? I wasn't sure where it wanted the next folders, so I put them in with cyan and magenta and duplicated the color scripts.

After step 7, I was completely confused and didn't know what to do. I'd love to go over this in class if possible.
